WorkshopPLUS - Power Platform: ALM with Dataverse 1 Day with Labs

WorkshopPLUS

Duration: 1 Day [Remote / Onsite]
Difficulty Level: 300 - Advanced

Description

This engagement is targeted at teams in the early phases of Application Lifecycle Management (ALM) adoption for the Power Platform. It will help you to build an understanding of the importance of continuous delivery and the value ALM can bring to your organization.

You will examine the core principles of ALM, the benefits of implementing a healthy ALM process, and gain practical applied knowledge. Also, a Microsoft instructor will demonstrate to you how to set up ALM.

Objectives

After attending this engagement, you will be able to:

- Implement a basic pipeline for Power Platform
- Architect solutions in a way that is conducive to team development
- Optimize your environment architecture strategy for team development
- Apply concepts learned to develop complex deployment pipelines for the Power Platform

Outcomes

- Develop a solid understanding of the concept of Application Lifecycle Management
- Learn how fundamental ALM principles and practices can be applied to the Power Platform
- Understand solution architecture best practices
- Understand environment architecture best practices

Methodology

Learn by example

You will work directly with a Microsoft engineer to learn by participating in demonstrations, presentations, and discussions.

Hands on

- You will learn many of the key concepts during hands-on labs and demonstrations.
- You will receive guidance materials to keep for your reference.

Scope

In scope

- The scope includes using ALM to build a basic pipeline and learn about team development best practices and anti-patterns to avoid.

Out of scope

- Not included in the scope is in-depth learning about Power Automate or Canvas app development.

Agenda

Day 1

- Introduction, Solution fundamentals, Team development, Azure DevOps for ALM or GitHub for ALM, Continuous deployment

Delivery Outline

Requirements

Participants

- IT staff

Delivery requirements

- Experience with developing solutions for Dynamics 365 Customer Engagement is *required*.
- Experience with standard development concepts such as version control and build pipelines is recommended.
- Experience with Azure DevOps or Visual Studio Team Services is desirable.
- A basic knowledge of Azure DevOps* or GitHub* is recommended. (This workshop focuses on leveraging the technologies for storing and deploying Power Platform components.)

Time commitment

- A one full-day commitment for relevant roles

Technical requirements

- Internet access with at least 1 Mbps bandwidth per participant
- Visual Studio Code or Visual Studio
- Git for Windows

Knowledge Transfer

Day 1
Modules 1-5

Module 1: Introduction to ALM

- Overview
- What is ALM?
- Why is ALM needed?
- Demonstration of a functioning pipeline

Module 2: Solution Fundamentals

- What is a solution?
- Working with solutions
- Managed vs. unmanaged solutions
- Solution architecture tools and techniques
    - Layering
    - Segmentation
    - Patching
    - Managed solution updates and upgrades
- Examples of solution layering and common anti-patterns
- Version control for solutions

Module 3: Team Development

- Continuous integration health check activity
- Continuous integration and its benefits
- Team development by example
- Environment architecture best practices
- Source control best practices

Module 4a: Azure DevOps for ALM

- High level overview of Azure Repos
- Azure pipelines key concepts
- Define pipelines using YAML syntax
- YAML by example

- OR -

Module 4b: GitHub for ALM

- High level overview of GitHub Actions
- GitHub workflows key concepts
- Define workflows using YAML syntax
- GitHub actions Demo

Module 5: Model-driven app – Continuous Deployment

- Continuous deployment health check activity
- Continuous deployment and its benefits
- Continuous Deployment by example
- Considerations for continuous solution deployment/delivery
